

Homework: two pages from project proposal

Select main page (from figma) show,

Button to switch to next page and.

```

224   bottomNavigationBar: BottomNavigationBar(
225     currentIndex: _currentIndex,
226     onTap: (index) {
227       setState(() {
228         if (index == 4) {
229           // Redirect to ProfilePage when the "Profile" tab is selected
230           Navigator.push(
231             context,
232             MaterialPageRoute(
233               builder: (context) => ProfilePage(founder: currentFounder),
234             ), // MaterialPageRoute
235           );
236         } else {
237           _currentIndex = index;
238         }
239       });
240     },
  
```

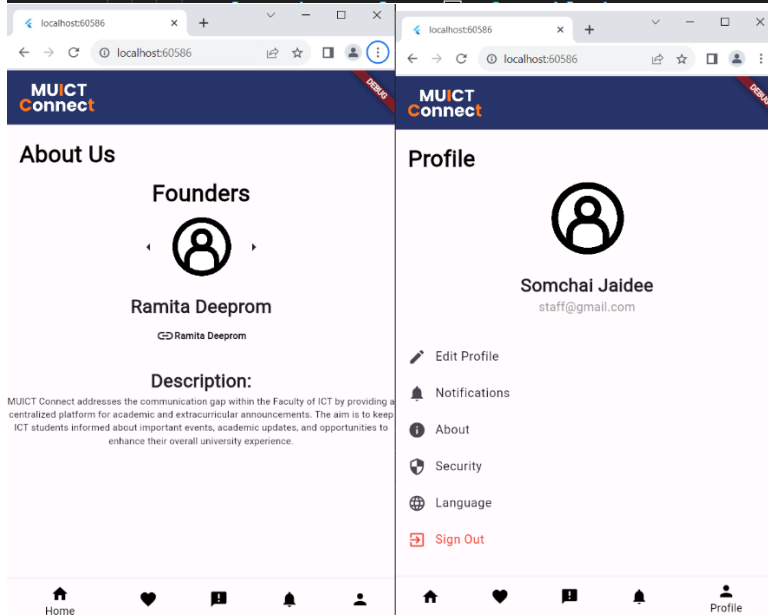

Passing argument to second route

```

268 class ProfilePage extends StatefulWidget {
269   final Founder founder;
270
271   ProfilePage({required this.founder});
272
273   @override
274   ProfilePageState createState() => _ProfilePageState();
275 }
276
  
```

At second page process your input data from first page and ~~show result on second page~~

```
222     bottomNavigationBar: BottomNavigationBar(  
223       currentIndex: _currentIndex,  
224       onTap: (index) {  
225         setState(() {  
226           if (index == 4) {  
227             // Redirect to ProfilePage when the "Profile" tab is selected  
228             Navigator.push(  
229               context,  
230               MaterialPageRoute(  
231                 builder: (context) => ProfilePage(founder: currentFounder),  
232               ), // MaterialPageRoute  
233             );  
234           } else {  
235             _currentIndex = index;  
236           }  
237         });  
238       },
```

In this code, the ProfilePage is a standalone page that doesn't require information from the AboutUsPage. It simply shows the "Profile" content without any connection to the selected Founder on the AboutUsPage.

Go back to Home page

```
348  
349     buildProfileOption('About', Icons.info, () {  
350       // Add navigation or functionality for About  
351       Navigator.push(  
352         context,  
353         MaterialPageRoute(  
354           builder: (context) => AboutUsPage(),  
355         ), // MaterialPageRoute  
356       );  
357     }),
```
